

I know that I have found all of them because the pegs and holes go round in a circle. For example this puzzle goes round like this . So I made four because you can make it go round two ways and then change the peg/hole in the middle.

I know that I have got all of them because I worked logically, starting at the pieces with no sides, then one side, then finally I did ^{the} corners.

My Estimate = 8 jigsaws.
I know I have found them all because I used the same method as I did in number 1.
