

★ Magic V's ★

Anshi and I did lots of different combinations for Magic V's which is our topic in mathematical mayhem. Magic V's are numbers from 4 to 5 in a V shape. Each side of the V should equal up to the same number. The middle number doesn't exactly matter. It's like an odd one out, spare number.

We came up with different V's in total with 3 different numbers in the middle. We only did it with odd numbers in the middle, but it is possible to do it with even numbers in the middle. We enjoyed doing the project and it really got our brains thinking.
