

# Niharika Paul What's that Graph?

## 1<sup>st</sup> graph

\* I found The distance a car travels ( $D$ ) is plotted against that this time ( $T$ ). This is ~~for~~ the case of a car after the acceleration is the pedal has been pushed.

Same as

## 2<sup>nd</sup> graph

I thought Here we plot the temperature of a hot drink ( $C$ ) of another against time ( $T$ ) process.

Years of

## 3<sup>rd</sup> graph

type Here we plot the volume taken up by paintbrushes left ( $V$ ) of the same geometry ( $N$ ) against no. of paintbrushes ( $N$ ), against

## 4<sup>th</sup> graph

edge ( $A$ ) Here I ~~will~~ bounce the ball with the same speed. I plot the height  $\oplus$  of the ball  $\ominus$  ( $H$ ) against time ( $T$ )

## 5<sup>th</sup> graph

We plot distance ( $D$ ) against time ( $T$ ).  $t=0$  corresponds to the time the car starts.

## 6<sup>th</sup> graph

Here we have a cup of juice and suck from it at a constant constant rate. We plot volume of juice ( $V$ ) against time ( $T$ )

## 7<sup>th</sup> graph

I throw a ball and catch it. Then we plot height of ball ( $H$ ) against time ( $T$ )

## 8<sup>th</sup> graph

Here we plot height of a girl after the age of 14 against time.
